Major Problems

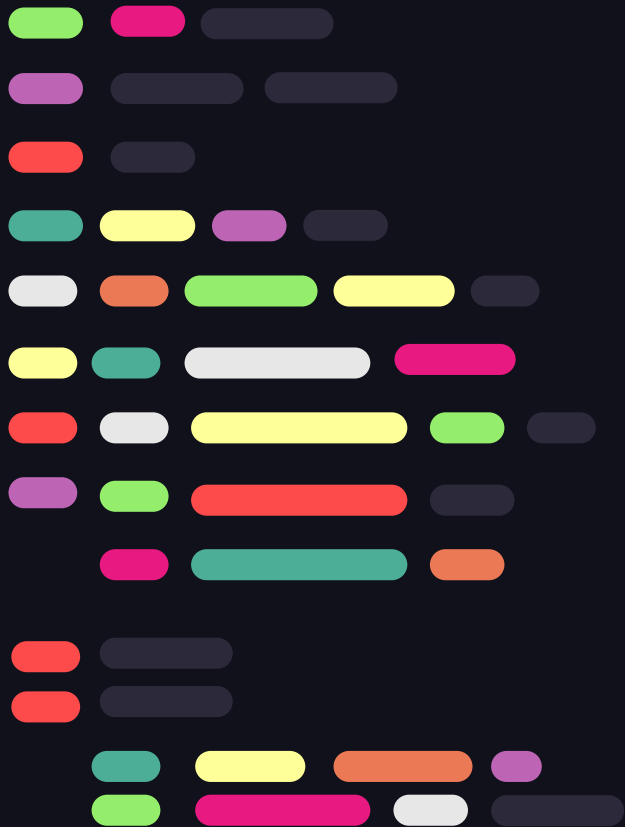

- The UnboundLocalError this error was a result of not reassigning the variable responsible for our header, 'header', under certain exception cases, so upon printing, the interpreter was unable to find the variable in memory.
- Transferring and combining the files after writing the menu program, and attempting to transfer it to other devices, we experienced issues with the execution of the menu program, whereby the program was unable to find the other modules.

Biggest Lessons

- The UnboundLocalError we must be careful of local assignment and understand that global accessibility is not, and should not be, available.
- Transferring and combining the files we learned that we must be more thorough in version control and testing, so that by the time we get to running our final test cases, we are not correcting major errors.
